# Fulfilling the Promises of Health Information Technology: **Are Metrics Measuring our Delivered Care?** Chintan Bhatt MBBS, MPH Donna Lee Armaignac PhD, APRN, CCNS, CCRN Center for Advanced Analytics, Baptist Health South Florida

### Background

- In the U.S., about 55,000 critically ill patients are cared for each day Hospital stays that involved ICU
- services are 2.5 times more costly than other hospital stays
- Between 2000 and 2005, annual critical care medicine costs increased from \$56.6 billion to \$81.7 billion, representing 13.4% of hospital costs, 4.1% of national health expenditures, and 0.66% of gross domestic product Cost savings of up to \$1 billion per
- quality life year gained can be attained with critical care management of severe sepsis, acute respiratory failure, and general critical care interventions.

## **Objectives**

- Assess if quality metrics and measures accurately reflect the clinical care provided in the ICU
- Examine if publicly reported outcomes (metrics & measures) reflect the quality of care provided in the ICU

## **Predictive Scoring Systems**

- Scores are measures of disease severity to predict likelihood of outcomes (e.g., APACHE-IV, MPM-III, SAPS3
- Valuable for standardizing research and quality comparisons

## **Utilization of Predictive Scoring Systems**

- Standardizing, stratifying and comparing severity adjustment
- Provide no assistance for patient management
- Validation external
- Calibration predictive agreement O/E over time
- Customization across a population (region, size, type, performance quartile) – need similar baseline risk
- Discrimination accuracy (alive or dead)
- Compare ourselves to others good internal validity

_			
	Table 1. Advantages and Disadvantages of Common Predictive Scoring Systems		
	Scoring system	Advantages	Disadvantages
	APACHE-IV	<ul> <li>Coefficients regularly updated-</li> <li>Provides algorithms for LOS prediction</li> <li>Specific algorithm to predict mortality in CABG surgery patients</li> <li>Less prone to be affected by the case-mix</li> </ul>	<ul> <li>Developmental sample restricted to one country</li> <li>More complex data collection</li> <li>High abstraction burden</li> <li>Proprietary scoring system</li> </ul>
	MPM0-III	<ul> <li>Less prone to inter-observer variability</li> <li>By using less physiologic data, may be</li> </ul>	<ul> <li>Developmental sample mostly restricted to one country</li> <li>More susceptible to case- mix effects</li> </ul>
	SAPS 3	<ul> <li>Less prone to inter-observer variability</li> <li>Customized equations to predict hospital</li> </ul>	<ul> <li>Does not provide estimation for LOS</li> <li>Some regional equations were developed using relatively low sample size</li> </ul>
		mortality according to seven different geographic regions	were developed us

## **Publicly Reported Metrics**

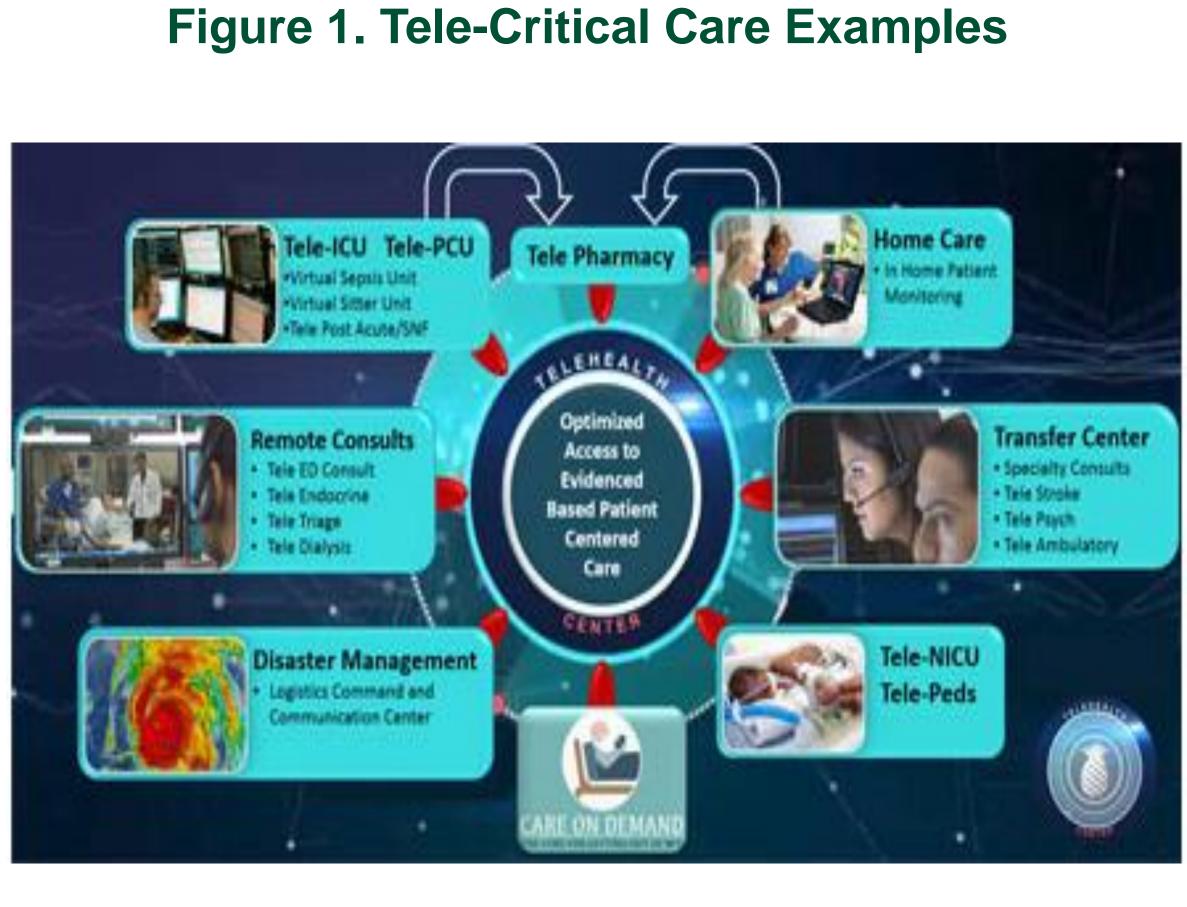

services

- https://www.sccm.org/Communications/Critical-Care-Statistics

- 31:1345.

### Conclusions

"What gets measured gets managed." Measurement combined with public reporting metrics can draw attention to particular areas of concern and stimulate improvement efforts

 Metrics are simplistic approximations of what clinicians and patients believe represents high quality of care

•Quality measurement enterprise operates separately from the workflows associated with delivering health care
